

# Losing weight is easy now.

## *Losing fat instead of muscle is not.*

A 2026 network meta-analysis of 9 randomized trials in 1,009 adults with overweight or obesity (Vandoni et al., *Obesity Reviews*) found that adding structured exercise to GLP-1 medication produced significantly greater improvements in fat mass, waist-to-hip ratio, insulin sensitivity, and HDL cholesterol than either approach alone. Your medication starts the change. What you do alongside it decides what kind of change it is.

### WHY YOUR DOCTOR RECOMMENDED THIS

- **GLP-1 medication reduces appetite, not just weight.**  
Eating less on purpose is the point of the medication. But eating less also means less protein coming in, and protein is what your body needs most to hold on to muscle while calories are down.
- **Some of the weight that comes off is muscle, not fat.**  
This is a well-documented risk with GLP-1 therapy, not a flaw in you. Muscle is where your body burns the most calories at rest and where it clears blood sugar after meals, so losing it works against the results you are after.
- **Exercise makes the medication work harder.**  
In the 2026 analysis above, adding structured exercise to GLP-1 treatment outperformed medication alone on fat mass, waist-to-hip ratio, insulin sensitivity, and HDL cholesterol. The combination beat either approach by itself.

### YOUR DAILY SUPPLEMENT

## Ultimate Fat Burner

NutriDyn | Practitioner Exclusive

Formulated with clinically studied doses of chromium, L-carnitine, and African mango extract to support healthy metabolism and body composition, promote the use of fat tissue as energy, support blood sugar levels already in a normal range, and support muscle repair and recovery, used in combination with proper diet and exercise.

### HOW TO TAKE IT

**Daily Dose:** 2 capsules

**Best Time:** With breakfast or your first meal

**Duration:** Daily, ongoing

**With GLP-1:** Follow your provider's dosing guidance

### KEY INGREDIENTS

- **L-Carnitine L-tartrate**  
Carries fat into your cells' energy-producing mitochondria to be burned as fuel.
- **African Mango Extract**  
Supports healthy leptin signaling, the hormone that tells your brain you're satisfied.
- **Chromium Picolinate**  
Helps insulin move blood sugar into cells more efficiently.

### WHAT TO EXPECT

#### Weeks 1 to 2

Support for energy and steady blood sugar while you build new eating and movement habits. Results vary by person.

#### Month 1 to 3

This is where body composition starts to show, not just the number on the scale. Protein intake and resistance training are what decide whether the weight lost is fat or muscle.

#### Long term

The goal is a body that holds its results: the muscle and metabolism to sustain them well beyond the medication.

YOUR PROTEIN AND MOVEMENT FOUNDATION

# Eat Enough. Move Often. Every Day.

GLP-1 medication shrinks your appetite, so every bite needs to work harder. A review on nutrition during GLP-1 treatment (Johnson et al., *Obesity Pillars*, 2025) recommends 1.2 to 2.0 grams of protein per kilogram of body weight per day, about 0.5 to 0.9 grams per pound, to help protect muscle while you lose fat. Pair that target with regular movement and the weight that comes off is more likely to be the weight you want gone.

| Food Group            | Serving            | Per Day | Best Choices                                                                                                                                                   |
|-----------------------|--------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protein               | 4 to 6 oz cooked   | 3 to 4  | Chicken breast, turkey, wild-caught fish, lean beef, eggs, Greek yogurt, cottage cheese, whey or plant protein shake. Make this the first thing on your plate. |
| Vegetables            | 1/2 to 1 cup       | 3 to 5  | Leafy greens, broccoli, peppers, zucchini, all non-starchy vegetables. Organic preferred.                                                                      |
| Fruits                | 1 small or 1/2 cup | 1 to 2  | Berries, apple, citrus. Whole fruit over juice, especially with a smaller appetite.                                                                            |
| Whole Grains          | 1/2 cup cooked     | 1 to 2  | Oats, brown rice, quinoa. Choose fiber-rich options; keep portions modest so protein still fits.                                                               |
| Healthy Fats          | 1 tsp to 1 Tbsp    | 2 to 3  | Extra-virgin olive oil, avocado, nuts, seeds. Avoid refined vegetable oils.                                                                                    |
| Dairy or Alternatives | 6 to 8 oz          | 1 to 2  | Plain Greek yogurt, milk, fortified soy milk. An easy way to add protein between meals.                                                                        |
| Fluids                | 8 oz               | 6 to 8+ | Water first, herbal tea. Sip steadily; thirst cues can shift on GLP-1 medication too.                                                                          |

| PROTEIN PER SERVING (APPROX.)   |            |
|---------------------------------|------------|
| Chicken breast, 4 oz            | 35 g       |
| Ground turkey, 4 oz             | 28 g       |
| Wild salmon, 4 oz               | 25 g       |
| Greek yogurt, 6 oz              | 17 g       |
| Eggs, 2 large                   | 12 g       |
| Cottage cheese, 1/2 cup         | 12 g       |
| Protein shake, 1 scoop          | 20 to 25 g |
| Tofu, 4 oz                      | 10 g       |
| Lentils or black beans, 1/2 cup | 8 to 9 g   |

| MOVEMENT TARGETS                 |                  |
|----------------------------------|------------------|
| Resistance / strength training   | 2 to 3x / wk     |
| All major muscle groups covered  | weekly           |
| Moderate cardio (walking counts) | ~150 min / wk    |
| Daily movement                   | most days        |
| Protein-containing meal or snack | every 3 to 4 hrs |

Cardio target reflects U.S. federal physical activity guidelines (ACSM/CDC), not a claim specific to this product.

**Always avoid:** Skipping meals, which makes your daily protein target harder to hit; filling a smaller appetite with chips, sweets, or refined carbs that crowd out protein; relying on cardio alone while skipping resistance training; and alcohol on training days, which competes with recovery.

**Quality matters:** Reach for whole-food protein first (chicken, fish, eggs, Greek yogurt) and use a protein shake to fill gaps, not replace meals. Take your Ultimate Fat Burner with a protein-containing meal.
